Bootstrap Introduction

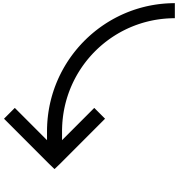
Brief introduction to Bootstrap | IRONHACK

What is Bootstrap?

... is a free and open-source CSS framework directed at responsive, mobile-first front-end web development. It contains CSS, and (optionally) JavaScript based design templates for typography, forms, buttons, navigations and other interface components.

When to use it..

- A library like bootstrap helps us create responsive web pages and simplify them somewhat.
- For a little mockup, to create something fast and show some ideas.
- The point is not use bootstrap for the entire design of the webpage.



HERE

Take look at the stylesheet, there will be a lot of CSS lines, grouped by classes.

To ensure proper rendering and touch zooming for all devices, add the responsive viewport meta tag to your `<head>`

```
<!DOCTYPE html>
<html lang="en">
  <head>
    <meta charset="utf-8" />
    <meta name="viewport"content="width=device-width, initial-scale=1, shrink-to-fit=no"/>
```

How to start...

- **Go to Bootstrap web page v4.5 ==> Home ==> Get started**
  -In case you want to link the CDN of Bootstrap straight in our HTML file.

```html
<!-- bootstrap 4 css -->
<link
  rel="stylesheet"
  href="https://cdn.jsdelivr.net/npm/bootstrap@4.5.3/dist/css/bootstrap.min.css"
  integrity="sha384-TX8t27EcRE3e/ihU7zmQxVncDAy5uIKz4rEkgIXeMed4M0jlfIDPvg6uqKI2xXr2"
  crossorigin="anonymous"
/>
```

- **Go to Bootstrap web page v4.5 ==> Home ==> Download**
  -In case you want to download Bootstrap to have it local.

- ***Important!*** link your own CSS file after any link of any library, just before the closing of the <head>.

How to start...

Important! The next three lines of Javascript code at the end of the <body> just before closing.

- The first script is a javascript library [Know more]
- Popper another library for some iterations.
- This library uses methods from the previous two, for that reason it is placed last.

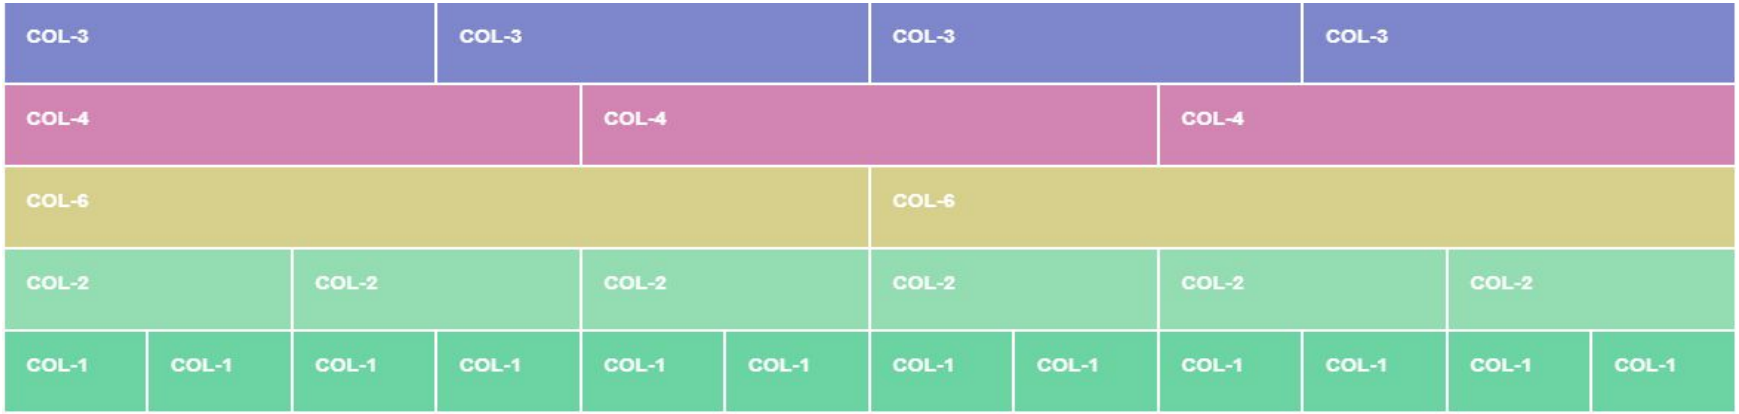
```
    <script
      src="https://code.jquery.com/jquery-3.5.1.slim.min.js"
      integrity="sha384-DfXdz2htPH0lsSSs5nCTpuj/zy4C+OGpamoFVy38MVBnE+IbbVYUew+OrCXaRkfj"
      crossorigin="anonymous"
    ></script>
    <script
      src="https://cdn.jsdelivr.net/npm/popper.js@1.16.1/dist/umd/popper.min.js"
      integrity="sha384-9/reFTGAW83EW2RDu2S0VKaIzap3H66lZH81PoYlFhbGU+6BZp6G7niu735Sk7lN"
      crossorigin="anonymous"
    ></script>
    <script
      src="https://cdn.jsdelivr.net/npm/bootstrap@4.5.3/dist/js/bootstrap.min.js"
      integrity="sha384-w1Q4orYjBQndcko6MimVbzY0tgp4pWB4lZ7lr30WKz0vr/aWKhXdBNmNb5D92v7s"
      crossorigin="anonymous"
    ></script>
  </body>
</html>
```

Bootstrap Grid System

It allows us to:

- Properly organize the content
- Create a responsive design by default
- Order, clarity and efficiency, within our html.

The system allows up to 12 columns, within each column it can be divided into another 12.



*** This is an advanced topic to handle this system, is there a lot of documentation about it [Grid system]**

Bootstrap Grid System

Bootstrap divides the space in three principal components:

1.Container ⟹ **2.Rows** ⟹ **3.Columns**

1. Class **container** & **container-fluid**: all rows must be inside the container for proper positioning.

2. Class **row**: horizontal groups of columns. Inside the container, contains the columns.

3. Class **col**: here the number of columns (max. 12) and classes for the width of each column are indicated.

```html
<!-- Has always a max-width that changes depending on the breakpoint, and is
centered on the page -->
<div class="container">
  <h1>Bootstrap Grid</h1>
  <!-- here our elements will take up the space of 6 colums from small screens and
  upwards; below the breakpoint of small screens, the elements will stack on top
  of each other -->
  <div class="row" id="first-row">
    <div class="col-sm-6">col-sm-6</div>
    <div class="col-sm-6">col-sm-6</div>
  </div>
  <!-- We can create different layout combinations depending on the size of the
  screen: for example here, we want our elements to take up the space of 6 columns
  from small screens and upwards (until medium screens), and of 3 columns from
  large screens and upwards -->
  <div class="row" id="third-row">
    <div class="col-sm-6 col-lg-3">col-sm-6 col-lg-3</div>
    <div class="col-sm-6 col-lg-3">col-sm-6 col-lg-3</div>
    <div class="col-sm-6 col-lg-3">col-sm-6 col-lg-3</div>
    <div class="col-sm-6 col-lg-3">col-sm-6 col-lg-3</div>
  </div>
  <!-- If no size is specified, columns are shown by default from extra small
  devices screens and upwards -->
  <div class="row" id="fourth-row">
    <div class="col-4">col-4</div>
    <div class="col-4">col-4</div>
    <div class="col-4">col-4</div>
  </div>
</div>
```

Components

You will find useful components to add to your projects and modify them:

- Modals
- Navbar
- Carousel
- Know more...

Utilities

this documentation is mainly about the implementation of CSS styles:

- Embed
- Flex
- Spacing
- Know more...

Content

All the info about HTML elements and also CSS styles:

- Typography
- Images
- Tables
- Know more...

Example
